

### Geophysical and Geological analysis. Technical Program for HSP well re-completion.

C	ollec	t/purchase/sorting/processing of necessary information:		
а	W	ell operation/exploitation history (production data)		
	•	monthly/daily productive inflow of oil, gas and water		
	•	number of productive and non-productive days per month		
	start and end (maximum and minimum) debit			
	•	tubing pressure (internal pressure of productive formation		
	•	extent the fall of productive inflow		
	•	stops and possible transitions to the next productive intervals		
b	All	possible logging (logs)		
	•	induction (electric) log		
	•	neutron and gamma-ray		
	•	acoustic (casing/cement) log		
	•	mud-log, chat-log		
С	W	ell information/documentation		
	•	design/construction (depths, casing (OD/ID)		
	opened productive intervals			
	techniques of opening the productive formations (casing, cen			
		productive formation)		
	•	using of hydraulic fracturing, chemical treatment, stimulation, etc.		
	•	previous closing and transitions to new productive intervals		
	•	packers, retainers, cementation, insulation/waterproofing, etc.		
d	All	possible tests results		
	•	oil		
	•	gas		
	•	water		
	•	pressure		
е	W	ell position map (preferably with an altitude)		
	•	position (distance) relative to the neighboring oil wells		
	•	position (distance) relative to the nearest injection wells		
f	Cc	pre analysis, lithology, etc. (core)		
	•	core analysis		
	•	rock sample's pictures		
	•	previous geology, lithology, core analysis		

\$ **500**.00

Ge	ophysi	ical and Geological analysis for HSP well's re-completion:						
а	Location of well's position in the deposit-field							
	well's map position relative to the neighboring oil/injection's wells							
	major characteristics of producing field							
b	Geol	ogical and Geophysical structure/structures						
	• C	ore, lithology, rock, formations						
	• p	orosity, permeability, pore's structure						
	• 0	oil, gas and water saturation						
С	Desig	gn and Logging						
	logging (induction (electric), neutron and gamma-ray, acoustic (casing/cement), mud-log, chat-log							
	• C	correlation with neighboring oil/injection's wells						
	• li	thological analysis						
d	Sumi	mary analysis of geological and geophysical data						
	• p	perspective productive Intervals						
	• r	ecommended for HSP cutting productive intervals						
	• p	pressure						
е	Prospects analysis							
	• r	esidual stock analysis by cumulative production method						
	• p	prospects analysis after HSP re-completion						
		\$ <b>500</b> .00						

Technical Project ("Cut Program", specification, schedule) a Calculation of technological parameters for HSP re-completion • Initial data • calculation of technological parameters • results of calculation of technological parameters b Technical Parameters • flow control valve pressure-temperature-cutting speed dependence nozzles, erosion, rate, connections surface equipment scheme hydro-slotting perforation process graph c Hydro-slotting perforation Program preparation for slot perforation process • hydro-slotting perforation (HSP) process • start- ending of HSP process possible violations of HSP process hydro-slotting perforation (HSP) technical schedule d Safety and operational requirements emergency medical response procedure • fire emergency procedure spill or release procedure H2S emergency procedure emergency response for storm response to a bomb threat emergency medical information forms \$ **500**.00

## **Preparation, preparatory, and HSP process expenses.**(based for standard HSP process during 10 days (2 days HSP process), with two HSP tool/equipment sets, and performed by two HSP experts)

(ergonomic one piece solid metal D-1/D-2 for 4/2 nozzles and ball valve seat)  • Nozzle MAXXWELL-NL1-07-06-0.2CONE  • Nozzle-holder (hardy/T°) MAXXWELL-NH1.2-1-1  • Plug/cup (one piece solid metal D-1/D-2)  • Plug/cup (one piece solid metal D-1/D-2)  • Copper sealing ring MAXXWELL-CR0.1  • Spring (for return unit) MAXXWELL-SP70X2.5  • Sinter metal valve ball to test the tightness of tubing connections  • Steel valve ball for HSP perforator  • Hydraulic oil "MAXXWELL-T" low temperature dependence of the viscosity  • Grease "MOBILE" for medium and high temperatures  • Grease "MOBILE" for medium and high temperatures  • assembly-disassembly, cleaning, inspection, adjustment  • installation and adjustment of control flow device for required temperature  • assembly-disassembly, testing HSP tool/equipment under required pressure and temperature, drawing up a table of measurements  • drawing up the individual graph of dependence for pressure, temperature, and cutting speed, separately for each HSP tool/equipment sets  • packaging/conservation  \$ 5,00

Example of invoice for standard well re-completion Geophysical and Geological analysis, and Technical Program for HSP well re-completion: http://www.maxxwell.net/Invoice.pdf

## Amortizations and current expenses.

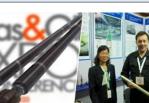

Maxxwell Production does not charges any additional fees for Geophysical and Geological analysis (only salary analysts), consumable and spare parts (manufacturer price), preparation HSP tool/equipment (only salary installers), and HSP re-completion process (only salary experts), therefore, to maintain the company in a good condition we are forced to charge a symbolic percentage for amortizations and current expenses.

		ion of amortization percentage (amortization and current expenses) -					
10%		service (approximately \$ 2,000.00 - \$ 3,000.00 from each well)					
а	Office	e, workshop, laboratory expenses					
	office, workshop, laboratory leases						
	electricity, water, gas, Internet, communications, security, CCTV						
	furniture and office equipment (computers, printers, copier, scanner, coffee maker, fridge, etc.						
	•	consumables materials for office, workshop and laboratory					
	•	office staff and helpers salary					
b	Trans	sport					
	•	gasoline					
	•	service and maintenance					
	consumables materials and spear parts						
	purchase of additional transport						
С	Tool/equipment						
	manufacture and replacement of HSP tool/equipment parts						
	•	manufacture of new HSP tool/equipment					
	•	manufacture of special tool/equipment					
	•	purchase of a new tool/equipment					
	•	working consumables materials for workshop and laboratory					
d	Resea	arch, development and improvement					
	•	styling/design, engineering/development, planning/projecting					
	•	calculations, mathematical and physical tests/analysis					
	•	prototyping and testing, improvement, introduction of new models					
	•	writing and implementation of new applications and patents					
	•	creating computer programs, publication of scientific articles					
	participation in scientific conferences, forums, special exhibitions

				\$ <b>113,442</b> .00				

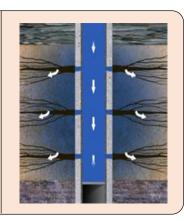

### Re-completion of nearby injector well with HSP Technology

(Determined according to the results of Geophysical and Geological analysis)

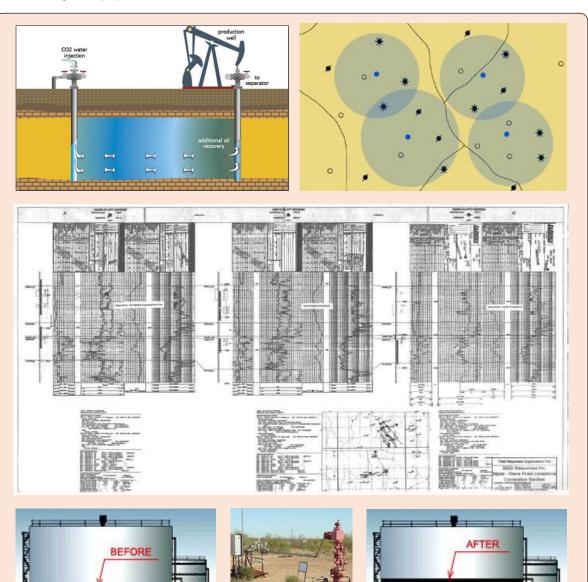

During long-time exploitation of oil well the internal pressure of productive formation is decreasing (sometimes to zero), although the remaining reserves have been extracted only at **40-50%** (and the remaining **50%** reserves are still in the ground). To increase the internal pressure of the productive formation using injection wells (existing or remaking an old oil well in the injector). The water from the injection well displaces oil and pushes it to the oil wells. Thus, in the neighboring oil wells, located nearby the injection well, the internal pressure of productive formation is increasing.

HSP perfectly restores the injection wells, increases the working area, creates geometry directed action, cleans and removes clogging, mudding, and colmatation (depends on the salt's composition of impurities and admixture). HSP allows reduce pumping rate in three (3) times less, and increase the beneficial effect in ten (10) times.

Injection wells increases the productive inflow in nearby oil wells up to 20%. Usually 3 or 4 low productivity oil wells used one injection well.

Re-c	-completion of injector well with HSP Technology (similar procedure as for oil well)									
а	Hyd	ro-slotting Perforation								
	•	Consumable and spare parts for HSP tool/equipment				\$ 9,530.00				
	•	Preparation of two HSP tool/equipment sets for each working day				\$ 5,000.00

#### Additional operations and expenses, if it recommended after Geophysical and Geological analysis

(Additional operations determined according to the results of Geophysical and Geological analysis)

**Hydro-slotting perforation** opens the whole zone of productive layer (all the pores of matrix), forms an excellent hydrodynamic connection well with the productive formation, unloads stress conditions in the near wellbore area and improves reservoir properties (increases the permeability and improves porosity). HSP increases productive inflow in dozens of times with lasting positive effect 10-15 years. However, this is not the limit. There are additional operations that can still increase the percent of productive inflow.

PROBLEM	Cement ring in a bad condition (cracks and micro cracks)					
CAUSE	Bad cement composition, or cement cracked from long time of exploitation, cement cracked in resulting of use cumulative perforation and subsequent hydraulic fracturing					
AFFECT	Cracks and micro cracks are forms capillary movement of water from water reservoirs to the productive layer, that leads to very rapid water flooding the producing formation					
RISK	If the borehole located near the water reservoirs, there is a risk of very rapid water flooding the producing formation					
SOLUTION	Repair cement ring or isolation packers watered productive interval, and transition to another productive interval (if there)					

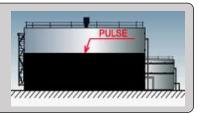

а	REPAIR of cement sheath									
	•	setting of packer (retainer) (packer-service company)	\$ 2,250 x 2	\$ 4,500.00						
	•	workover (Rig + team/staff + labor)	\$ 2,750/day x 2 day	\$ 5,500.00						
	•	bentonite sealing solution (amount according to the project)		\$ 1,250.00						
	•	sealing the borehole with bentonite solution		-						
	•	one passage the borehole by scraper + one passage the borehole by caliber		-						
				\$ <b>11,250</b> .00						

		•							
	•	one passage the borehole by scraper + one passage the borehole by caliber		-					
				\$ <b>11,250</b> .00					
b	b ISOLATION of water flooding interval with permanent non-removable packers or/and cementation								
	•	setting of packer (packer-service company)	\$ 2,250 x 1	\$ 2,250.00					
	•	workover (Rig + team/staff + labor)	\$ 2,750/day x 2 day	\$ 5,500.00					
	•	sealing cement bags (amount according to the project)		\$ 3,500.00					
	•	sealing the borehole with cement		-					
	•	one passage the borehole by scraper + one passage the borehole by caliber		-					
				\$ <b>11,250</b> .00					
	•	contingencies coefficient (5%)		\$ 1,125.00					
				\$ <b>12,375</b> .00					

#### Additional stimulation of productive inflows with PULSED ELECTRIC HYDRAULIC SHOCKS

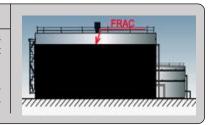

Additional stimulation of productive inflows with pulsed electric hydraulic shocks is performing after complete Hydro-slotting perforation (HSP) process, and flushing all cut intervals and borehole. It is stimulates the formation of more micro cracks, and further increases the area of hydrodynamic contact the well with productive formation. According to statistics, this procedure can stimulate an increase of productive inflow 30% more from existing).

С	Addi	ditional stimulation of productive inflows with pulsed electric hydraulic shocks			
	•	Wireline logging service (similar procedure for cased hole logging)	\$ 5,730.00		
	•	Pulsed electric hydraulic shocks service (tool/equipment + team/staff + labor)	\$ 15,000.00		
			\$ <b>20,730</b> .00		

#### Additional stimulation of productive inflows with gentle HYDRAULIC FRACTURING

Additional stimulation of productive inflows with gentle hydraulic fracturing (4000 psi) is performing after complete Hydro-slotting perforation (HSP) process, and flushing all cut intervals and borehole. HSP sets a good geometry for subsequent hydraulic fracturing, and stimulates the formation of more **extended** deep and long cracks and micro cracks, and further increases the area of hydrodynamic contact the well with productive formation. According to statistics, this procedure can stimulate an increase of productive inflow **60**% more from existing).

d	Addi	Additional stimulation of productive inflows with gentle hydraulic fracturing				
	Workover (Rig + rig's pump + team/stuff)					
	•	Workover (Rig + team/staff + Labor: installation/construction/re-completion)	\$ 2,750/day x 1 day	\$ 2,750.00		
	Fracking (pumping) service with crew					
	•	Triplex Plunger Pump (up to 6000 psi pressure, and up to 10000 bbl./min rate)		\$ 15,850.00		
	•	Frack-van (monitoring center)		-		
	•	high pressure line, connections, misc., valves, fittings, joint-pipes		-		
	•	Manifold-block (direct-back flushing)		\$ 250.00		
	•	Blender track (or mobile mixer)		\$ 500.00		
	•	Proppant (sticky sand sand) with delivery	\$ 500.00 x 18 ton	\$ 9,000.00		
	•	abrasive quartz/glass sand (optional garnet sand) with delivery	\$ 300.00 x 12 ton	\$ 3,600.00		
	•	setting of packer/retainer (one passing) (packer-service company)	\$ 2,250 x 2 packers	\$ 4,500.00		
				\$ <b>36,450</b> .00		
	•	contingencies coefficient (5%)	\$ 1,125.00	\$ 3,645.00		
				\$ <b>40,095</b> .00
